Chapter 1

Namespace Index

1.1 Namespace List

Here is a list of all namespaces with brief descriptions:

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Chapter 4

File Index

4.1 File List

Here is a list of all files with brief descriptions:

Chapter 5

Namespace Documentation

5.1 CNNClassifier Namespace Reference

Classes

- class CNNArchitecture

  Architecture du réseau de neurones convolutif (CNN) définie avec PyTorch.
- class CNNClassifier

5.2 Controller Namespace Reference

Classes

- class Controller

5.3 DataHandler Namespace Reference

Classes

- class DataHandler

5.4 DecisionTreeClassifier Namespace Reference

Classes

- class DecisionTreeClassifier

5.5 functions Namespace Reference

Functions

- convert_time (secondes)

5.5.1 Function Documentation

5.5.1.1 convert_time()

```
functions.convert_time (
              secondes )
```

Definition at line 1 of file functions.py.

5.6 GBMClassifier Namespace Reference

Classes

- class GBMClassifier

5.7 ImageProcessor Namespace Reference

Classes

- class ImageProcessor

5.8 Logger Namespace Reference

Classes

- class Logger

Functions

- get_log_color (tag)

  Retourne la couleur Tkinter associée à un tag de log donné.

5.8.1 Function Documentation

5.8.1.1 get_log_color()

```
Logger.get_log_color (
              tag )
```

Retourne la couleur Tkinter associée à un tag de log donné.

Parameters

tag	(str) Le niveau ou type de log (ex: "WARNING", "ERROR", "SUCCESS", "RESULT").

Returns

(str) Le nom de la couleur correspondante (ex: "orange", "red", "green").

Definition at line 11 of file Logger.py.

5.9 LogisticRegressionClassifier Namespace Reference

Classes

- class LogisticRegressionClassifier

5.10 main Namespace Reference

Variables

- window = Window()
- Controller = Controller(window)

5.10.1 Variable Documentation

5.10.1.1 Controller

```
main.Controller = Controller(window)
```

Definition at line 14 of file main.py.

5.10.1.2 window

```
main.window = Window()
```

Definition at line 13 of file main.py.

5.11 Metrics Namespace Reference

Classes

- class Metrics

5.12 Model Namespace Reference

Classes

- class Model

5.13 RandomForestClassifier Namespace Reference

Classes

- class RandomForestClassifier

5.14 SingletonMeta Namespace Reference

Classes

- class SingletonMeta

5.15 SVMClassifier Namespace Reference

Classes

- class SVMClassifier

5.16 TqdmToLogger Namespace Reference

Classes

- class TqdmToLogger

5.17 Window Namespace Reference

Classes

- class Window

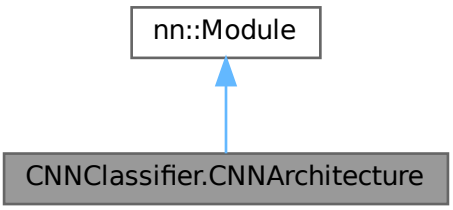
Chapter 6

Class Documentation

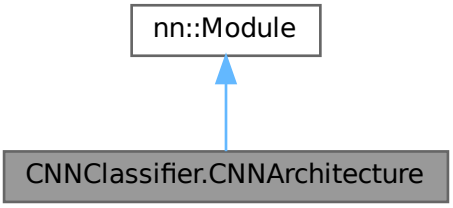
6.1 CNNClassifier.CNNArchitecture Class Reference

Architecture du réseau de neurones convolutif (CNN) définie avec PyTorch.

Inheritance diagram for CNNClassifier.CNNArchitecture:



Collaboration diagram for CNNClassifier.CNNArchitecture:



Public Member Functions

- __init__ (self)
- forward (self, x)

  Définit la passe avant (forward pass) du réseau.

Public Attributes

- conv1_1
- bn1_1
- conv1_2
- bn1_2
- pool1
- dropout1
- conv2_1
- bn2_1
- conv2_2
- bn2_2
- pool2
- dropout2
- conv3_1
- bn3_1
- conv3_2
- bn3_2
- pool3
- dropout3
- flatten
- fc1
- bn_fc
- dropout_fc
- fc2
- relu

6.1.1 Detailed Description

Architecture du réseau de neurones convolutif (CNN) définie avec PyTorch.

Comprend 3 blocs de convolution (Conv2d -> BatchNorm -> ReLU -> MaxPool -> Dropout) suivis de couches dense (Fully Connected). Conçu pour des entrées image 32x32x3.

Definition at line 21 of file CNNClassifier.py.

6.1.2 Constructor & Destructor Documentation

6.1.2.1 __init__()

```
CNNClassifier.CNNArchitecture.__init__ (
              self )
```

Definition at line 23 of file CNNClassifier.py.

6.1.3 Member Function Documentation

6.1.3.1 forward()

```
CNNClassifier.CNNArchitecture.forward (
              self,
              x )
```

Définit la passe avant (forward pass) du réseau.

Parameters

x	(torch.Tensor) Tenseur d'entrée (Batch, 3, 32, 32).

Returns

torch.Tensor Logits de sortie (Batch, 10).

Definition at line 57 of file CNNClassifier.py.

6.1.4 Member Data Documentation

6.1.4.1 bn1_1

```
CNNClassifier.CNNArchitecture.bn1_1
```

Definition at line 26 of file CNNClassifier.py.

6.1.4.2 bn1_2

```
CNNClassifier.CNNArchitecture.bn1_2
```

Definition at line 28 of file CNNClassifier.py.

6.1.4.3 bn2_1

```
CNNClassifier.CNNArchitecture.bn2_1
```

Definition at line 33 of file CNNClassifier.py.

6.1.4.4 bn2_2

```
CNNClassifier.CNNArchitecture.bn2_2
```

Definition at line 35 of file CNNClassifier.py.

6.1.4.5 bn3_1

`CNNClassifier.CNNArchitecture.bn3_1`

Definition at line 40 of file CNNClassifier.py.

6.1.4.6 bn3_2

`CNNClassifier.CNNArchitecture.bn3_2`

Definition at line 42 of file CNNClassifier.py.

6.1.4.7 bn_fc

`CNNClassifier.CNNArchitecture.bn_fc`

Definition at line 48 of file CNNClassifier.py.

6.1.4.8 conv1_1

`CNNClassifier.CNNArchitecture.conv1_1`

Definition at line 25 of file CNNClassifier.py.

6.1.4.9 conv1_2

`CNNClassifier.CNNArchitecture.conv1_2`

Definition at line 27 of file CNNClassifier.py.

6.1.4.10 conv2_1

`CNNClassifier.CNNArchitecture.conv2_1`

Definition at line 32 of file CNNClassifier.py.

6.1.4.11 conv2_2

`CNNClassifier.CNNArchitecture.conv2_2`

Definition at line 34 of file CNNClassifier.py.

6.1.4.12 conv3_1

`CNNClassifier.CNNArchitecture.conv3_1`

Definition at line 39 of file CNNClassifier.py.

6.1.4.13 conv3_2

`CNNClassifier.CNNArchitecture.conv3_2`

Definition at line 41 of file CNNClassifier.py.

6.1.4.14 dropout1

`CNNClassifier.CNNArchitecture.dropout1`

Definition at line 30 of file CNNClassifier.py.

6.1.4.15 dropout2

`CNNClassifier.CNNArchitecture.dropout2`

Definition at line 37 of file CNNClassifier.py.

6.1.4.16 dropout3

`CNNClassifier.CNNArchitecture.dropout3`

Definition at line 44 of file CNNClassifier.py.

6.1.4.17 dropout_fc

`CNNClassifier.CNNArchitecture.dropout_fc`

Definition at line 49 of file CNNClassifier.py.

6.1.4.18 fc1

`CNNClassifier.CNNArchitecture.fc1`

Definition at line 47 of file CNNClassifier.py.

6.1.4.19 fc2

`CNNClassifier.CNNArchitecture.fc2`

Definition at line 50 of file CNNClassifier.py.

6.1.4.20 flatten

`CNNClassifier.CNNArchitecture.flatten`

Definition at line 46 of file CNNClassifier.py.

6.1.4.21 pool1

`CNNClassifier.CNNArchitecture.pool1`

Definition at line 29 of file CNNClassifier.py.

6.1.4.22 pool2

`CNNClassifier.CNNArchitecture.pool2`

Definition at line 36 of file CNNClassifier.py.

6.1.4.23 pool3

`CNNClassifier.CNNArchitecture.pool3`

Definition at line 43 of file CNNClassifier.py.

6.1.4.24 relu

`CNNClassifier.CNNArchitecture.relu`

Definition at line 51 of file CNNClassifier.py.

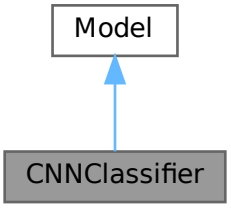
The documentation for this class was generated from the following file:

- src/CNNClassifier.py

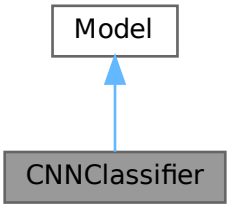
6.2 CNNClassifier Class Reference

Adaptateur pour le modèle CNN PyTorch intégrant la structure de la classe Model.

Inheritance diagram for CNNClassifier:



Collaboration diagram for CNNClassifier:



6.2.1 Detailed Description

Adaptateur pour le modèle CNN PyTorch intégrant la structure de la classe Model.

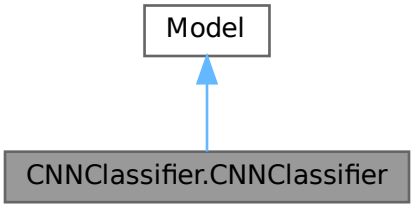
Gère spécifiquement les tenseurs PyTorch, l'utilisation du GPU (CUDA), la boucle d'entraînement manuelle et l'Early Stopping.

The documentation for this class was generated from the following file:

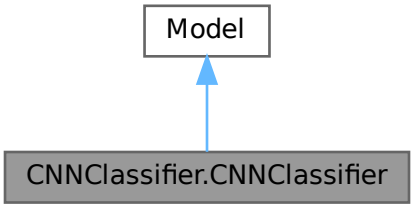
- src/CNNClassifier.py

6.3 CNNClassifier.CNNClassifier Class Reference

Inheritance diagram for CNNClassifier.CNNClassifier:



Collaboration diagram for CNNClassifier.CNNClassifier:



Public Member Functions

- __init__ (self, logger, n_train, n_val)
- tuple train (self, dict data_dict, class_names=None)

  Surcharge de la méthode d'entraînement pour PyTorch.
- dict test (self, dict data_dict, class_names=None)

  Surcharge de la méthode de test pour PyTorch.
- int classify (self, np.ndarray image)

  Inférence sur une seule image avec PyTorch.
- None save_model (self)

  Sauvegarde les poids du modèle (state_dict) via torch.save.
- None load_model (self)

  Charge les poids du modèle (state_dict) via torch.load.

Public Attributes

- device
- model_path
- history
- tqdm_out
- model
- logger

Protected Member Functions

- _create_model (self, ∗∗kwargs)
- _predict_batch (self, X_tensor, y_tensor)

  Méthode utilitaire interne pour prédire sur un grand jeu de données par lots.

6.3.1 Detailed Description

Definition at line 86 of file CNNClassifier.py.

6.3.2 Constructor & Destructor Documentation

6.3.2.1 __init__()

```
CNNClassifier.CNNClassifier.__init__ (
              self,
              logger,
              n_train,
              n_val )
```

Definition at line 87 of file CNNClassifier.py.

6.3.3 Member Function Documentation

6.3.3.1 _create_model()

```
CNNClassifier.CNNClassifier._create_model (
              self,
             ** kwargs )  [protected]
```

Definition at line 95 of file CNNClassifier.py.

6.3.3.2 _predict_batch()

```
CNNClassifier.CNNClassifier._predict_batch (
              self,
              X_tensor,
              y_tensor )  [protected]
```

Méthode utilitaire interne pour prédire sur un grand jeu de données par lots.

Parameters

X_tensor	(torch.Tensor) Données d'entrée.
y_tensor	(torch.Tensor) Labels (utilisés uniquement pour créer le Dataset compatible).

Returns

np.ndarray Tableau numpy des classes prédites.

Definition at line 327 of file CNNClassifier.py.

6.3.3.3 classify()

```
int CNNClassifier.CNNClassifier.classify (
              self,
             np.ndarray image )
```

Inférence sur une seule image avec PyTorch.

Gère le redimensionnement (32, 32, 3) et le passage sur le device (CPU/GPU).

Parameters

image	(np.ndarray) Image brute.

Returns

int Indice de la classe prédite.

Definition at line 356 of file CNNClassifier.py.

6.3.3.4 load_model()

```
None CNNClassifier.CNNClassifier.load_model (
              self )
```

Charge les poids du modèle (state_dict) via torch.load.

Assure le mapping correct sur le device (CPU/GPU).

Definition at line 382 of file CNNClassifier.py.

6.3.3.5 save_model()

```
None CNNClassifier.CNNClassifier.save_model (
              self )
```

Sauvegarde les poids du modèle (state_dict) via torch.save.

Definition at line 374 of file CNNClassifier.py.

6.3.3.6 test()

```
dict CNNClassifier.CNNClassifier.test (
              self,
             dict data_dict,
              class_names = None )
```

Surcharge de la méthode de test pour PyTorch.

Convertit les données de test en tenseurs et effectue l'inférence par batch pour éviter les erreurs de mémoire (OOM).

Parameters

data_dict	(dict) Données de test.
class_names	(list, optional) Noms des classes.

Returns

dict Métriques de performance sur le jeu de test.

Definition at line 289 of file CNNClassifier.py.

6.3.3.7 train()

```
tuple CNNClassifier.CNNClassifier.train (
              self,
             dict data_dict,
              class_names = None )
```

Surcharge de la méthode d'entraînement pour PyTorch.

Gère :

- La conversion des données Numpy vers des Tenseurs PyTorch (permute channels).
- La création des DataLoaders.
- La boucle d'entraînement sur 50 époques avec barre de progression (tqdm).
- L'optimiseur Adam et le Scheduler ReduceLROnPlateau.
- L'Early Stopping basé sur la `val_loss`.
- La sauvegarde de l'historique d'apprentissage.

Parameters

data_dict	(dict) Données d'entraînement.
class_names	(list, optional) Noms des classes.

Returns

tuple (model, metrics) Le modèle PyTorch (nn.Module) et les métriques finales.

Definition at line 110 of file CNNClassifier.py.

6.3.4 Member Data Documentation

6.3.4.1 device

```
CNNClassifier.CNNClassifier.device
```

Definition at line 89 of file CNNClassifier.py.

6.3.4.2 history

```
CNNClassifier.CNNClassifier.history
```

Definition at line 92 of file CNNClassifier.py.

6.3.4.3 logger

`CNNClassifier.CNNClassifier.logger`

Definition at line 264 of file CNNClassifier.py.

6.3.4.4 model

`CNNClassifier.CNNClassifier.model`

Definition at line 133 of file CNNClassifier.py.

6.3.4.5 model_path

`CNNClassifier.CNNClassifier.model_path`

Definition at line 90 of file CNNClassifier.py.

6.3.4.6 tqdm_out

`CNNClassifier.CNNClassifier.tqdm_out`

Definition at line 93 of file CNNClassifier.py.

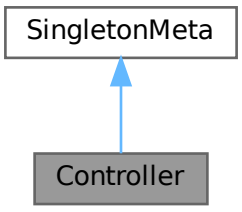
The documentation for this class was generated from the following file:

- src/CNNClassifier.py

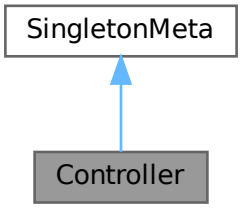
6.4 Controller Class Reference

Contrôleur principal de l'application (Pattern MVC).

Inheritance diagram for Controller:



Collaboration diagram for Controller:



6.4.1 Detailed Description

Contrôleur principal de l'application (Pattern MVC).

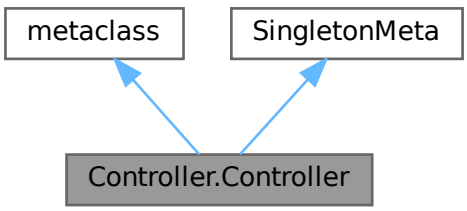
Cette classe fait le lien entre l'interface graphique (Window) et la logique métier (Modèles, DataHandler). Elle gère les événements utilisateur, valide les entrées, et exécute les tâches lourdes (entraînement, test, inférence) dans des threads séparés pour maintenir la réactivité de l'interface.

The documentation for this class was generated from the following file:

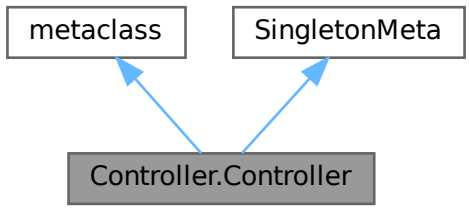
- Controller.py

6.5 Controller.Controller Class Reference

Inheritance diagram for Controller.Controller:



Collaboration diagram for Controller.Controller:



Public Member Functions

- __init__ (self, window)

  Constructeur de la classe Controller.
- start_train (self)

  Déclenche le processus d'entraînement.
- start_test (self)

  Déclenche le processus de test.
- start_classify (self)

  Déclenche le processus d'inférence (classification).
- check_inputs (self, action)

  Valide les entrées du formulaire de l'interface graphique.

Public Attributes

- window
- logger
- dataset
- train_data
- val_data
- data_handler
- model
- training_counter
- inference_path
- model_classes

Protected Member Functions

- _train_model_thread (self, model_name)

  Logique métier de l'entraînement (exécutée dans un thread).
- _display_training_results (self, model_name, metrics_data)

  Met à jour l'interface graphique avec les résultats de l'entraînement.
- _reset_train_button (self)

  Réactive le bouton d'entraînement à la fin du thread.
- _test_model_thread (self, model_name)

Logique métier du test (exécutée dans un thread).

- _display_test_results (self, model_name, metrics_data)

  Affiche les résultats du test dans l'interface graphique.
- _reset_test_button (self)

  Réactive le bouton de test à la fin du thread.
- _classify_model_thread (self, model_name)

  Logique métier de l'inférence (exécutée dans un thread).
- _display_classification_results (self, results_data)

  Affiche les résultats de classification dans l'interface.
- _reset_classify_button (self)

  Réactive le bouton d'inférence à la fin du thread.

Protected Attributes

- _display_training_results
- _reset_train_button
- _display_test_results
- _reset_test_button
- _display_classification_results
- _reset_classify_button

6.5.1 Detailed Description

Definition at line 24 of file Controller.py.

6.5.2 Constructor & Destructor Documentation

6.5.2.1 __init__()

```
Controller.Controller.__init__ (
              self,
              window )
```

Constructeur de la classe Controller.

Initialise le logger, configure les callbacks des boutons de l'interface graphique et initialise le dictionnaire des classes de modèles disponibles.

Parameters

window	(Window) L'instance de la fenêtre principale de l'application.

Definition at line 30 of file Controller.py.

6.5.3 Member Function Documentation

6.5.3.1 _classify_model_thread()

```
Controller.Controller._classify_model_thread (
```

```
                self,
                model_name )  [protected]
```

Logique métier de l'inférence (exécutée dans un thread).

Charge le modèle, prépare les images (fichier unique ou dossier) et exécute la prédiction.

Parameters

model_name	(str) Le nom du modèle à utiliser.

Definition at line 256 of file Controller.py.

6.5.3.2 _display_classification_results()

```
Controller.Controller._display_classification_results (
                self,
                results_data )  [protected]
```

Affiche les résultats de classification dans l'interface.

Parameters

results_data	(list) Liste de tuples contenant les noms de fichiers, prédictions et images.

Definition at line 338 of file Controller.py.

6.5.3.3 _display_test_results()

```
Controller.Controller._display_test_results (
                self,
                model_name,
                metrics_data )  [protected]
```

Affiche les résultats du test dans l'interface graphique.

Parameters

model_name	(str) Nom du modèle testé.
metrics_data	(dict) Dictionnaire des métriques de test.

Definition at line 214 of file Controller.py.

6.5.3.4 _display_training_results()

```
Controller.Controller._display_training_results (
                self,
```

```
                model_name,
                metrics_data )  [protected]
```

Met à jour l'interface graphique avec les résultats de l'entraînement.

Crée un nouvel onglet dans la fenêtre via `window.create_training_results_tab`.

Parameters

model_name	(str) Le nom du modèle entraîné.
metrics_data	(dict) Les métriques et graphiques résultants de l'entraînement.

Definition at line 126 of file Controller.py.

6.5.3.5 _reset_classify_button()

```
Controller.Controller._reset_classify_button (
                self )  [protected]
```

Réactive le bouton d'inférence à la fin du thread.

Definition at line 347 of file Controller.py.

6.5.3.6 _reset_test_button()

```
Controller.Controller._reset_test_button (
                self )  [protected]
```

Réactive le bouton de test à la fin du thread.

Definition at line 230 of file Controller.py.

6.5.3.7 _reset_train_button()

```
Controller.Controller._reset_train_button (
                self )  [protected]
```

Réactive le bouton d'entraînement à la fin du thread.

Definition at line 153 of file Controller.py.

6.5.3.8 _test_model_thread()

```
Controller.Controller._test_model_thread (
                self,
                model_name )  [protected]
```

Logique métier du test (exécutée dans un thread).

Charge le modèle sélectionné (sans l'entraîner) et lance la méthode `test` du modèle.

Parameters

model_name	(str) Le nom du modèle à tester.

Definition at line 179 of file Controller.py.

6.5.3.9 _train_model_thread()

```
Controller.Controller._train_model_thread (
              self,
              model_name )  [protected]
```

Logique métier de l'entraînement (exécutée dans un thread).

Charge les données via DataHandler, instancie le modèle sélectionné, lance l'entraînement et demande l'affichage des résultats une fois terminé.

Parameters

model_name	(str) Le nom du modèle à entraîner.

Definition at line 89 of file Controller.py.

6.5.3.10 check_inputs()

```
Controller.Controller.check_inputs (
              self,
              action )
```

Valide les entrées du formulaire de l'interface graphique.

Parameters

action	(str) L'action demandée : "train", "test" ou "classify".

Returns

(bool) True si toutes les entrées requises sont valides, False sinon.

Definition at line 356 of file Controller.py.

6.5.3.11 start_classify()

```
Controller.Controller.start_classify (
              self )
```

Déclenche le processus d'inférence (classification).

Vérifie les entrées, désactive le bouton d'inférence et lance le thread associé.

Definition at line 236 of file Controller.py.

6.5.3.12 start_test()

```
Controller.Controller.start_test (
              self )
```

Déclenche le processus de test.

Vérifie les entrées, désactive le bouton de test et lance le thread de test.

Definition at line 159 of file Controller.py.

6.5.3.13 start_train()

```
Controller.Controller.start_train (
              self )
```

Déclenche le processus d'entraînement.

Vérifie les entrées utilisateur via check_inputs(), désactive le bouton d'entraînement et lance l'exécution de `train_model_thread` dans un thread séparé.

Definition at line 59 of file Controller.py.

6.5.4 Member Data Documentation

6.5.4.1 _display_classification_results

```
Controller.Controller._display_classification_results  [protected]
```

Definition at line 324 of file Controller.py.

6.5.4.2 _display_test_results

```
Controller.Controller._display_test_results  [protected]
```

Definition at line 199 of file Controller.py.

6.5.4.3 _display_training_results

```
Controller.Controller._display_training_results  [protected]
```

Definition at line 110 of file Controller.py.

6.5.4.4 _reset_classify_button

```
Controller.Controller._reset_classify_button  [protected]
```

Definition at line 333 of file Controller.py.

6.5.4.5 _reset_test_button

`Controller.Controller._reset_test_button [protected]`

Definition at line 208 of file Controller.py.

6.5.4.6 _reset_train_button

`Controller.Controller._reset_train_button [protected]`

Definition at line 119 of file Controller.py.

6.5.4.7 data_handler

`Controller.Controller.data_handler`

Definition at line 41 of file Controller.py.

6.5.4.8 dataset

`Controller.Controller.dataset`

Definition at line 38 of file Controller.py.

6.5.4.9 inference_path

`Controller.Controller.inference_path`

Definition at line 44 of file Controller.py.

6.5.4.10 logger

`Controller.Controller.logger`

Definition at line 32 of file Controller.py.

6.5.4.11 model

`Controller.Controller.model`

Definition at line 42 of file Controller.py.

6.5.4.12 model_classes

`Controller.Controller.model_classes`

Definition at line 46 of file Controller.py.

6.5.4.13 train_data

`Controller.Controller.train_data`

Definition at line 39 of file Controller.py.

6.5.4.14 training_counter

`Controller.Controller.training_counter`

Definition at line 43 of file Controller.py.

6.5.4.15 val_data

`Controller.Controller.val_data`

Definition at line 40 of file Controller.py.

6.5.4.16 window

`Controller.Controller.window`

Definition at line 31 of file Controller.py.

The documentation for this class was generated from the following file:

- Controller.py

6.6 DataHandler Class Reference

Gestionnaire de données pour le chargement et le prétraitement du dataset CIFAR-10.

6.6.1 Detailed Description

Gestionnaire de données pour le chargement et le prétraitement du dataset CIFAR-10.

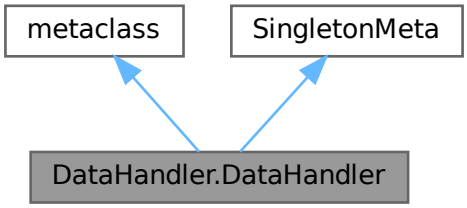
Cette classe s'occupe de lire les fichiers binaires (pickle), de charger les données d'entraînement et de test, de normaliser les pixels et de redimensionner les images selon les besoins des modèles.

The documentation for this class was generated from the following file:

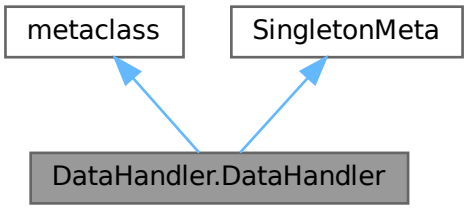
- utils/DataHandler.py

6.7 DataHandler.DataHandler Class Reference

Inheritance diagram for DataHandler.DataHandler:



Collaboration diagram for DataHandler.DataHandler:



Public Member Functions

- __init__ (self, logger, str base_path)

  Initialise le gestionnaire de données.
- dict unpickle (self, str filename)

  Méthode utilitaire interne pour désérialiser un fichier pickle.
- dict load_data (self, bool normalize=True, bool flatten=True)

  Charge l'intégralité du dataset (Train + Test) en mémoire.
- tuple get_train_data (self)

  Retourne les données d'entraînement (X, y).
- tuple get_test_data (self)

  Retourne les données de test (X, y).
- dict get_data_dict (self)

  Retourne le dictionnaire complet des données chargées.
- dict get_subset (self, int n_train=None, int n_test=None)

  Extrait un sous-ensemble des données chargées (utile pour le débogage ou les tests rapides).
- dict get_class_distribution (self, str dataset="train")

Calcule et affiche la distribution des classes dans un jeu de données.

- tuple get_sample (self, int index, str dataset="train")

  Récupère un échantillon unique par son index.
- tuple get_batch (self, list indices, str dataset="train")

  Récupère un lot d'échantillons donnés par une liste d'indices.
- get_class_names (self)

  Retourne la liste des noms lisibles des classes (ex: "Airplane", "Bird"...).
- get_data (self)

  Retourne les données.

Public Attributes

- logger
- base_path
- data
- train_data
- train_labels
- test_data
- test_labels
- class_names

6.7.1 Detailed Description

Definition at line 13 of file DataHandler.py.

6.7.2 Constructor & Destructor Documentation

6.7.2.1 __init__()

```
DataHandler.DataHandler.__init__ (
              self,
              logger,
             str base_path )
```

Initialise le gestionnaire de données.

Parameters

base_path	(str) Chemin vers le dossier contenant les fichiers du dataset (data_batch_x).

Exceptions

FileNotFoundError	Si le dossier spécifié n'existe pas.

Definition at line 19 of file DataHandler.py.

6.7.3 Member Function Documentation

6.7.3.1 get_batch()

```
tuple DataHandler.DataHandler.get_batch (
              self,
             list indices,
             str  dataset = "train" )
```

Récupère un lot d'échantillons donnés par une liste d'indices.

Parameters

indices	(list) Liste des indices à récupérer.
dataset	(str) "train" ou "test".

Returns

tuple (images, labels).

Definition at line 210 of file DataHandler.py.

6.7.3.2 get_class_distribution()

```
dict DataHandler.DataHandler.get_class_distribution (
              self,
             str  dataset = "train" )
```

Calcule et affiche la distribution des classes dans un jeu de données.

Parameters

dataset	(str) "train" pour les données d'entraînement, "test" pour les données de test.

Returns

dict Dictionnaire associant chaque nom de classe à son nombre d'occurrences.

Exceptions

ValueError	Si les données ne sont pas chargées.

Definition at line 173 of file DataHandler.py.

6.7.3.3 get_class_names()

```
DataHandler.DataHandler.get_class_names (
              self )
```

Retourne la liste des noms lisibles des classes (ex: "Airplane", "Bird"...).

Returns

list Liste de chaînes de caractères.

Definition at line 222 of file DataHandler.py.

6.7.3.4 get_data()

```
DataHandler.DataHandler.get_data (
              self )
```

Retourne les données.

Returns

dict Dictionnaire complet contenant "train_data", "train_labels", "test_data", "test_labels".

Definition at line 228 of file DataHandler.py.

6.7.3.5 get_data_dict()

```
dict DataHandler.DataHandler.get_data_dict (
              self )
```

Retourne le dictionnaire complet des données chargées.

Returns

dict Dictionnaire avec clés 'train_data', 'train_labels', 'test_data', 'test_labels'.

Exceptions

ValueError	Si load_data() n'a pas été appelé au préalable.

Definition at line 141 of file DataHandler.py.

6.7.3.6 get_sample()

```
tuple DataHandler.DataHandler.get_sample (
              self,
             int index,
             str  dataset = "train" )
```

Récupère un échantillon unique par son index.

Parameters

index	(int) L'index de l'échantillon.
dataset	(str) "train" ou "test".

Returns

tuple (image, label).

Definition at line 196 of file DataHandler.py.

6.7.3.7 get_subset()

```
dict DataHandler.DataHandler.get_subset (
              self,
             int  n_train = None,
             int  n_test = None )
```

Extrait un sous-ensemble des données chargées (utile pour le débogage ou les tests rapides).

Parameters

n_train	(int, optional) Nombre d'échantillons d'entraînement à conserver.
n_test	(int, optional) Nombre d'échantillons de test à conserver.

Returns

dict Dictionnaire contenant les sous-ensembles de données.

Exceptions

ValueError	Si les données n'ont pas encore été chargées.

Definition at line 152 of file DataHandler.py.

6.7.3.8 get_test_data()

```
tuple DataHandler.DataHandler.get_test_data (
              self )
```

Retourne les données de test (X, y).

Returns

tuple (test_data, test_labels).

Exceptions

ValueError	Si load_data() n'a pas été appelé au préalable.

Definition at line 132 of file DataHandler.py.

6.7.3.9 get_train_data()

```
tuple DataHandler.DataHandler.get_train_data (
              self )
```

Retourne les données d'entraînement (X, y).

Returns

tuple (train_data, train_labels).

Exceptions

ValueError	Si load_data() n'a pas été appelé au préalable.

Definition at line 123 of file DataHandler.py.

6.7.3.10 load_data()

```
dict DataHandler.DataHandler.load_data (
              self,
             bool  normalize = True,
             bool  flatten = True )
```

Charge l'intégralité du dataset (Train + Test) en mémoire.

Lit les 5 batches d'entraînement et le batch de test.

Parameters

normalize	(bool) Si True, divise les valeurs des pixels par 255.0 (float). Sinon, garde les valeurs brutes.
flatten	(bool) Si True, retourne les images sous forme de vecteurs (N, 3072). Si False, retourne les images sous forme de tenseurs (N, 3, 32, 32).

Definition at line 66 of file DataHandler.py.

6.7.3.11 unpickle()

```
dict DataHandler.DataHandler.unpickle (
              self,
            str filename )
```

Méthode utilitaire interne pour désérialiser un fichier pickle.

Parameters

filename	(str) Nom du fichier à charger (relatif au base_path).

Returns

dict Le contenu brut du fichier pickle.

Exceptions

FileNotFoundError	Si le fichier n'est pas trouvé.

Definition at line 49 of file DataHandler.py.

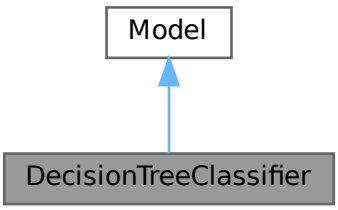
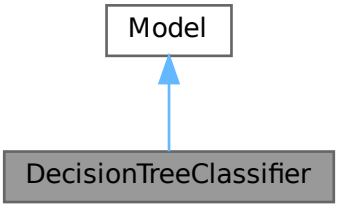
6.8 DecisionTreeClassifier Class Reference

Implémentation d'un classificateur par Arbre de Décision.

Inheritance diagram for DecisionTreeClassifier:



Collaboration diagram for DecisionTreeClassifier:



6.8.1 Detailed Description

Implémentation d'un classificateur par Arbre de Décision.

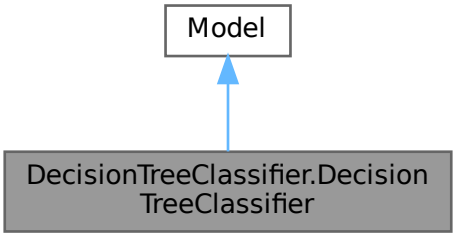
Utilise `sklearn.tree.DecisionTreeClassifier` avec une profondeur maximale de 30 et le critère de Gini.

The documentation for this class was generated from the following file:

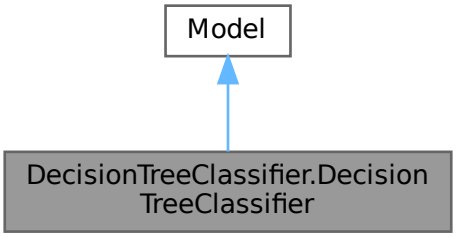
- src/DecisionTreeClassifier.py

6.9 DecisionTreeClassifier.DecisionTreeClassifier Class Reference

Inheritance diagram for DecisionTreeClassifier.DecisionTreeClassifier:



Collaboration diagram for DecisionTreeClassifier.DecisionTreeClassifier:



Public Member Functions

- __init__ (self, logger, n_train, n_val)

Protected Member Functions

- _create_model (self, ∗∗kwargs)

  Instancie l'arbre de décision avec des hyperparamètres pré-définis.

6.9.1 Detailed Description

Definition at line 11 of file DecisionTreeClassifier.py.

6.9.2 Constructor & Destructor Documentation

6.9.2.1 __init__()

```
DecisionTreeClassifier.DecisionTreeClassifier.__init__ (
              self,
              logger,
              n_train,
              n_val )
```

Definition at line 13 of file DecisionTreeClassifier.py.

6.9.3 Member Function Documentation

6.9.3.1 _create_model()

```
DecisionTreeClassifier.DecisionTreeClassifier._create_model (
              self,
             ** kwargs )  [protected]
```

Instancie l'arbre de décision avec des hyperparamètres pré-définis.

Parameters

kwargs	Arguments supplémentaires pour le constructeur DecisionTreeClassifier.

Returns

sklearn.tree.DecisionTreeClassifier Le modèle configuré.

Definition at line 20 of file DecisionTreeClassifier.py.

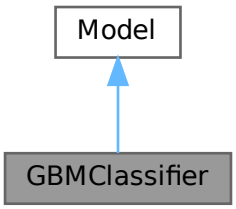
The documentation for this class was generated from the following file:

- src/DecisionTreeClassifier.py

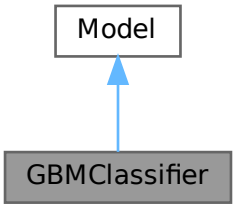
6.10 GBMClassifier Class Reference

Implémentation d'un classificateur Gradient Boosting Machine (Histogram-based).

Inheritance diagram for GBMClassifier:



Collaboration diagram for GBMClassifier:



6.10.1 Detailed Description

Implémentation d'un classificateur Gradient Boosting Machine (Histogram-based).

Optimisé pour les grands jeux de données, utilise `HistGradientBoostingClassifier` précédé d'une standardisation des données.

The documentation for this class was generated from the following file:

- src/GBMClassifier.py

6.11 GBMClassifier.GBMClassifier Class Reference

```
GBMClassifier.GBMClassifier._create_model (
              self,
             ** kwargs )  [protected]
```

Crée le pipeline GBM.

Parameters

kwargs	Arguments supplémentaires pour `HistGradientBoostingClassifier`.

Returns

sklearn.pipeline.Pipeline Pipeline configuré (StandardScaler -> HistGradientBoostingClassifier).

Definition at line 22 of file GBMClassifier.py.

The documentation for this class was generated from the following file:

- src/GBMClassifier.py

6.12 ImageProcessor Class Reference

Classe utilitaire pour le chargement et le prétraitement des images d'inférence.

6.12.1 Detailed Description

Classe utilitaire pour le chargement et le prétraitement des images d'inférence.

The documentation for this class was generated from the following file:

- utils/ImageProcessor.py

6.13 ImageProcessor.ImageProcessor Class Reference

Static Public Member Functions

- np.ndarray load_and_preprocess (str file_path)

  Charge une image depuis un fichier, la redimensionne et la normalise.

6.13.1 Detailed Description

Definition at line 8 of file ImageProcessor.py.

6.13.2 Member Function Documentation

6.13.2.1 load_and_preprocess()

```
np.ndarray ImageProcessor.ImageProcessor.load_and_preprocess (
            str file_path )  [static]
```

Charge une image depuis un fichier, la redimensionne et la normalise.

Convertit l'image en RGB, redimensionne en 32x32 (format CIFAR-10), et normalise les pixels (float entre 0.0 et 1.0).

Parameters

file_path	(str) Le chemin complet vers le fichier image.

Returns

np.ndarray Un tableau numpy de forme (32, 32, 3).

Exceptions

ValueError	Si l'image ne peut pas être chargée ou traitée.

Definition at line 18 of file ImageProcessor.py.

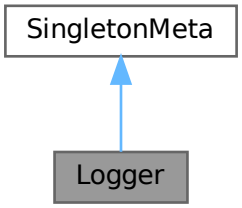
The documentation for this class was generated from the following file:

- utils/ImageProcessor.py

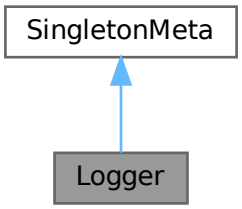
6.14 Logger Class Reference

Classe gérant l'affichage des logs dans la console de l'interface graphique.

Inheritance diagram for Logger:



Collaboration diagram for Logger:



6.14.1 Detailed Description

Classe gérant l'affichage des logs dans la console de l'interface graphique.

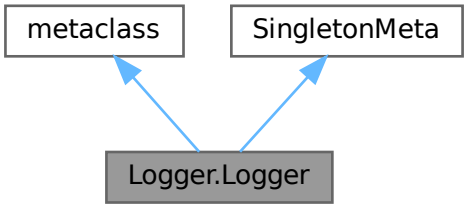
Utilise le pattern Singleton pour être accessible globalement depuis n'importe quelle partie du code. Gère l'écriture thread-safe (via update Tkinter) dans un widget Text.

The documentation for this class was generated from the following file:

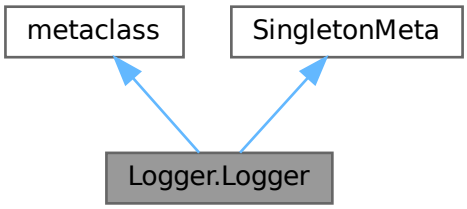
- utils/Logger.py

6.15 Logger.Logger Class Reference

Inheritance diagram for Logger.Logger:



Collaboration diagram for Logger.Logger:



Public Member Functions

- __init__ (self, root, console)

  Constructeur de la classe Logger.
- log (self, message, tag="INFO", buffered=False)

  Ajoute un message dans la console de logs.

Public Attributes

- console
- root

6.15.1 Detailed Description

Definition at line 33 of file Logger.py.

6.15.2 Constructor & Destructor Documentation

6.15.2.1 __init__()

```
Logger.Logger.__init__ (
              self,
              root,
              console )
```

Constructeur de la classe Logger.

Parameters

root	(tk.Tk) L'objet racine de la fenêtre (nécessaire pour forcer la mise à jour graphique).
console	(tk.Text) Le widget Text de l'interface où les logs seront insérés.

Definition at line 39 of file Logger.py.

6.15.3 Member Function Documentation

6.15.3.1 log()

```
Logger.Logger.log (
              self,
              message,
              tag = "INFO",
              buffered = False )
```

Ajoute un message dans la console de logs.

Active temporairement l'édition du widget, insère le message avec un timestamp et la couleur appropriée, scrolle automatiquement vers le bas, puis désactive l'édition.

Parameters

message	(str) Le texte du message à logger.
tag	(str) Le type de message déterminant la couleur (par défaut "INFO").
buffered	(bool) Si True, supprime les lignes précédentes avant d'écrire (utile pour les barres de progression dynamiques).

Definition at line 50 of file Logger.py.

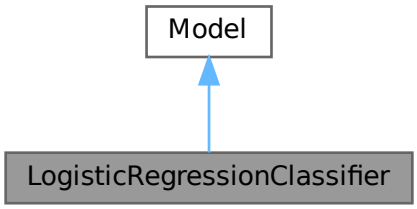
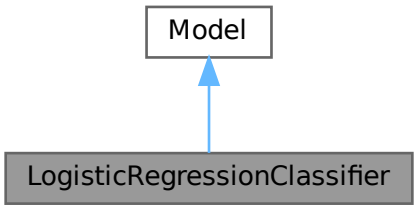
6.16 LogisticRegressionClassifier Class Reference

Implémentation d'un classificateur par Régression Logistique.

Inheritance diagram for LogisticRegressionClassifier:



Collaboration diagram for LogisticRegressionClassifier:



6.16.1 Detailed Description

Implémentation d'un classificateur par Régression Logistique.

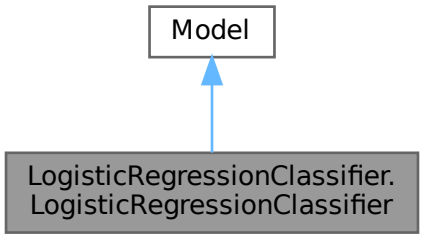
Utilise un pipeline avec Standardisation et PCA (95% variance) avant la régression logistique (solver lbfgs).

The documentation for this class was generated from the following file:

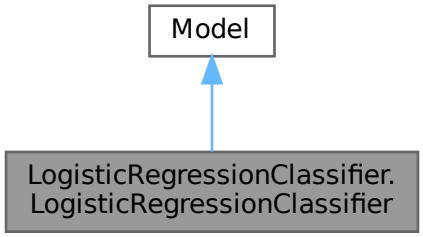
- src/LogisticRegressionClassifier.py

6.17 LogisticRegressionClassifier.LogisticRegressionClassifier Class Reference

Inheritance diagram for LogisticRegressionClassifier.LogisticRegressionClassifier:



Collaboration diagram for LogisticRegressionClassifier.LogisticRegressionClassifier:



Public Member Functions

- __init__ (self, logger, n_train, n_val)

Protected Member Functions

- _create_model (self, **kwargs)

  Crée le pipeline de Régression Logistique.

6.17.1 Detailed Description

Definition at line 14 of file LogisticRegressionClassifier.py.

6.17.2 Constructor & Destructor Documentation

6.17.2.1 __init__()

```
LogisticRegressionClassifier.LogisticRegressionClassifier.__init__ (
              self,
              logger,
              n_train,
              n_val )
```

Definition at line 16 of file LogisticRegressionClassifier.py.

6.17.3 Member Function Documentation

6.17.3.1 _create_model()

```
LogisticRegressionClassifier.LogisticRegressionClassifier._create_model (
              self,
             ** kwargs )  [protected]
```

Crée le pipeline de Régression Logistique.

Parameters

kwargs	Arguments supplémentaires pour `LogisticRegression`.

Returns

sklearn.pipeline.Pipeline Pipeline configuré (StandardScaler -> PCA -> LogisticRegression).

Definition at line 23 of file LogisticRegressionClassifier.py.

The documentation for this class was generated from the following file:

- src/LogisticRegressionClassifier.py

6.18 Metrics Class Reference

Classe utilitaire statique pour le calcul, la visualisation et la comparaison des performances des modèles.

Public Attributes

- list class_names

6.18.1 Detailed Description

Classe utilitaire statique pour le calcul, la visualisation et la comparaison des performances des modèles.

Cette classe regroupe des méthodes statiques permettant de calculer les métriques standards (Accuracy, F1, etc.), de générer des matrices de confusion, de tracer l'historique d'entraînement et de comparer plusieurs modèles entre eux. Elle gère également l'inférence spécifique selon le type de framework (Sklearn, PyTorch, Keras).

6.18.2 Member Data Documentation

6.18.2.1 class_names

```
list Metrics.class_names
```

Initial value:

```
=  [
    "airplane",
    "automobile",
    "bird",
    "cat",
    "deer",
    "dog",
    "frog",
    "horse",
    "ship",
    "truck",
]
```

Definition at line 16 of file Metrics.py.

The documentation for this class was generated from the following file:

- utils/Metrics.py

6.19 Metrics.Metrics Class Reference

Static Public Member Functions

- dict calculate_metrics (logger, y_true, y_pred, model_name="Model")

  Calcule un ensemble complet de métriques de classification.
- np.ndarray plot_confusion_matrix (y_true, y_pred, model_name="Model", save_path=None)

  Génère et affiche la matrice de confusion sous forme de heatmap.
- Figure plot_training_history (history, model_name="Model", save_path="_results")

  Trace les courbes d'apprentissage (Accuracy et Loss) pour l'entraînement et la validation.
- None compare_models (dict metrics_dict, save_path="model_comparison.png")

  Compare visuellement et textuellement les performances de plusieurs modèles.
- dict get_precision_recall_f1 (y_true, y_pred, model_name="Model", average="macro")

  Récupère les métriques de précision, rappel et F1, soit par classe, soit moyennées.
- np.ndarray get_predictions (model, data, model_type="sklearn")

  Wrapper universel pour obtenir les prédictions d'un modèle quel que soit son type.

6.19.1 Detailed Description

Definition at line 36 of file Metrics.py.

6.19.2 Member Function Documentation

6.19.2.1 calculate_metrics()

```
dict Metrics.Metrics.calculate_metrics (
              logger,
              y_true,
              y_pred,
              model_name = "Model" )  [static]
```

Calcule un ensemble complet de métriques de classification.

Affiche un rapport textuel dans la console (Accuracy, F1 Macro/Weighted, Precision, Recall) et retourne un dictionnaire contenant ces valeurs ainsi que la matrice de confusion brute.

Parameters

y_true	(array-like) Les étiquettes réelles (ground truth).
y_pred	(array-like) Les étiquettes prédites par le modèle.
model_name	(str) Nom du modèle pour l'affichage (par défaut "Model").

Returns

dict Dictionnaire contenant les clés : 'accuracy', 'f1_macro', 'f1_weighted', 'f1_per_class', 'precision_macro', 'recall_macro', 'confusion_matrix'.

Definition at line 48 of file Metrics.py.

6.19.2.2 compare_models()

```
None Metrics.Metrics.compare_models (
             dict metrics_dict,
              save_path = "model_comparison.png" )  [static]
```

Compare visuellement et textuellement les performances de plusieurs modèles.

Génère un tableau comparatif dans la console et sauvegarde un graphique en barres comparant l'Accuracy, le F1 Macro et le F1 Weighted.

Parameters

metrics_dict	(dict) Dictionnaire où la clé est le nom du modèle et la valeur est son dictionnaire de métriques (issu de calculate_metrics).
save_path	(str) Nom du fichier image de sortie (par défaut 'model_comparison.png').

Definition at line 174 of file Metrics.py.

6.19.2.3 get_precision_recall_f1()

```
dict Metrics.Metrics.get_precision_recall_f1 (
              y_true,
```

```
            y_pred,
            model_name = "Model",
            average = "macro" )  [static]
```

Récupère les métriques de précision, rappel et F1, soit par classe, soit moyennées.

Parameters

y_true	(array-like) Étiquettes réelles.
y_pred	(array-like) Étiquettes prédites.
model_name	(str) Nom du modèle.
average	(str, optional) Type de moyenne ('macro', 'weighted', 'micro') ou None pour obtenir les scores par classe.

Returns

dict Dictionnaire contenant les scores demandés (clés dépendantes du paramètre average).

Definition at line 226 of file Metrics.py.

6.19.2.4 get_predictions()

```
np.ndarray Metrics.Metrics.get_predictions (
            model,
            data,
            model_type = "sklearn" )  [static]
```

Wrapper universel pour obtenir les prédictions d'un modèle quel que soit son type.

Gère le formatage des données (reshape, conversion tenseurs) et l'appel d'inférence pour Sklearn, PyTorch et Keras.

Parameters

model	L'objet modèle entraîné.
data	(np.ndarray) Les données d'entrée brutes.
model_type	(str) Le type de framework : 'sklearn', 'pytorch', ou 'keras'.

Returns

np.ndarray Tableau numpy 1D contenant les indices des classes prédites.

Definition at line 271 of file Metrics.py.

6.19.2.5 plot_confusion_matrix()

```
np.ndarray Metrics.Metrics.plot_confusion_matrix (
            y_true,
            y_pred,
```

```
                model_name = "Model",
                save_path = None )  [static]
```

Génère et affiche la matrice de confusion sous forme de heatmap.

Utilise Seaborn pour l'affichage graphique.

Parameters

y_true	(array-like) Les étiquettes réelles.
y_pred	(array-like) Les étiquettes prédites.
model_name	(str) Nom du modèle pour le titre du graphique.
save_path	(str, optional) Chemin complet pour sauvegarder l'image (ex: "cm.png"). Si None, ne sauvegarde pas.

Returns

np.ndarray La matrice de confusion brute (numpy array).

Definition at line 96 of file Metrics.py.

6.19.2.6 plot_training_history()

```
Figure Metrics.Metrics.plot_training_history (
                history,
                model_name = "Model",
                save_path = "_results" )  [static]
```

Trace les courbes d'apprentissage (Accuracy et Loss) pour l'entraînement et la validation.

Crée une figure avec deux sous-graphiques : un pour l'accuracy, un pour la loss.

Parameters

history	(dict ou object) Objet retourné par l'entraînement (doit contenir les clés 'accuracy', 'val_accuracy', 'loss', 'val_loss'). Peut être un objet Keras History ou un dictionnaire.
model_name	(str) Nom du modèle.
save_path	(str) Dossier de destination pour la sauvegarde de l'image (par défaut "_results").

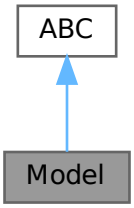
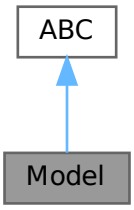
6.20 Model Class Reference

Classe abstraite de base pour tous les modèles de classification.

Inheritance diagram for Model:



Collaboration diagram for Model:



6.20.1 Detailed Description

Classe abstraite de base pour tous les modèles de classification.

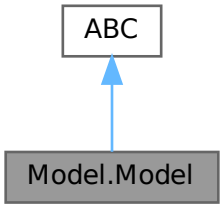
Cette classe gère le cycle de vie complet des modèles : préparation des données, entraînement, évaluation, tests, inférence unique et persistance (sauvegarde/chargement).

The documentation for this class was generated from the following file:

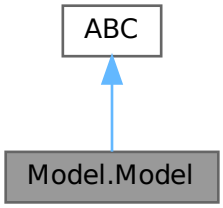
- src/Model.py

6.21 Model.Model Class Reference

Inheritance diagram for Model.Model:



Collaboration diagram for Model.Model:



Public Member Functions

- __init__ (self, logger, n_train, n_val, model_name="BaseModel")

  Constructeur de la classe Model.
- tuple train (self, dict data_dict, class_names=None)

  Exécute le pipeline d'entraînement complet.
- dict test (self, dict data_dict, class_names=None)

  Évalue le modèle sur un jeu de données de test indépendant.
- classify (self, np.ndarray image)

  Effectue une inférence sur une image unique.
- None save_model (self)

  Sauvegarde l'instance du modèle sur le disque via pickle.
- None load_model (self)

  Charge le modèle depuis le disque s'il existe.

Public Attributes

- logger
- n_train
- n_val
- model_name
- model_path
- model

Protected Member Functions

- _create_model (self, ∗∗kwargs)

  Méthode abstraite pour l'instanciation du modèle sous-jacent.
- _prepare_data (self, data_dict)

  Prépare et divise les données brutes en ensembles d'entraînement et de validation.
- _generate_cm_figure (self, cm, class_names)

6.21.1 Detailed Description

Definition at line 24 of file Model.py.

6.21.2 Constructor & Destructor Documentation

6.21.2.1 __init__()

```
Model.Model.__init__ (
               self,
               logger,
               n_train,
               n_val,
               model_name = "BaseModel" )
```

Constructeur de la classe Model.

Parameters

n_train	(int) Nombre d'échantillons à utiliser pour l'entraînement.
n_val	(int) Nombre d'échantillons à utiliser pour la validation.
model_name	(str) Nom identifiant du modèle (par défaut "BaseModel").

Note

Définit le chemin de sauvegarde automatique dans le dossier `_models/`.

Definition at line 31 of file Model.py.

6.21.3 Member Function Documentation

6.21.3.1 _create_model()

```
Model.Model._create_model (
              self,
             ** kwargs )  [protected]
```

Méthode abstraite pour l'instanciation du modèle sous-jacent.

Parameters

kwargs	Arguments variables pour la configuration spécifique du modèle.

Returns

L'objet modèle brut (sklearn ou autre) non entraîné.

Note

Doit être implémentée par toutes les classes filles.

Definition at line 45 of file Model.py.

6.21.3.2 _generate_cm_figure()

```
Model.Model._generate_cm_figure (
              self,
              cm,
              class_names )  [protected]
```

Definition at line 74 of file Model.py.

6.21.3.3 _prepare_data()

```
Model.Model._prepare_data (
              self,
              data_dict )  [protected]
```

Prépare et divise les données brutes en ensembles d'entraînement et de validation.

Parameters

data_dict	(dict) Dictionnaire contenant les clés "train_data" et "train_labels".

Returns

tuple (X_train, X_val, y_train, y_val) Les données divisées et stratifiées.

Definition at line 52 of file Model.py.

6.21.3.4 classify()

```
Model.Model.classify (
              self,
             np.ndarray image )
```

Effectue une inférence sur une image unique.

Parameters

image	(np.ndarray) L'image d'entrée (vecteur ou matrice).

Returns

int La classe prédite par le modèle.

Definition at line 159 of file Model.py.

6.21.3.5 load_model()

```
None Model.Model.load_model (
              self )
```

Charge le modèle depuis le disque s'il existe.

Exceptions

FileNotFoundError	Si le fichier du modèle n'existe pas.

Definition at line 184 of file Model.py.

6.21.3.6 save_model()

```
None Model.Model.save_model (
              self )
```

Sauvegarde l'instance du modèle sur le disque via pickle.

Note

Le fichier est stocké dans `_models/{model_name}.pkl`.

Definition at line 175 of file Model.py.

6.21.3.7 test()

```
dict Model.Model.test (
              self,
             dict data_dict,
              class_names = None )
```

Évalue le modèle sur un jeu de données de test indépendant.

Charge le modèle sauvegardé, effectue les prédictions et calcule les métriques.

Parameters

data_dict	(dict) Dictionnaire contenant "test_data" et "test_labels".
class_names	(list, optional) Liste des noms de classes pour la matrice de confusion.

Returns

dict Dictionnaire contenant les métriques de performance (accuracy, f1, confusion matrix, etc.).

Definition at line 137 of file Model.py.

6.21.3.8 train()

```
tuple Model.Model.train (
              self,
             dict data_dict,
              class_names = None )
```

Exécute le pipeline d'entraînement complet.

Prépare les données, redimensionne (flatten) si nécessaire, entraîne le modèle, et évalue les performances sur le set de validation.

Parameters

data_dict	(dict) Dictionnaire des données d'entraînement et labels.
class_names	(list, optional) Liste des noms de classes pour l'annotation de la matrice de confusion.

Returns

tuple (model, metrics) Le modèle entraîné et un dictionnaire de métriques de validation.

Definition at line 95 of file Model.py.

6.21.4 Member Data Documentation

6.21.4.1 logger

```
Model.Model.logger
```

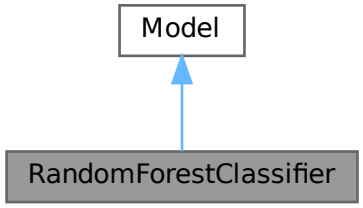
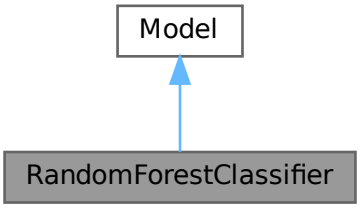
6.22 RandomForestClassifier Class Reference

Implémentation d'un classificateur Random Forest.

Inheritance diagram for RandomForestClassifier:



Collaboration diagram for RandomForestClassifier:



6.22.1 Detailed Description

Implémentation d'un classificateur Random Forest.

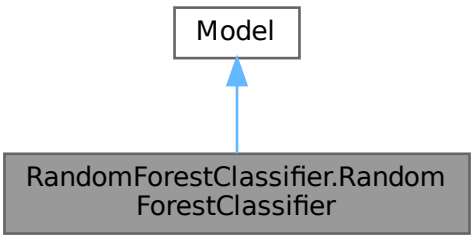
Ensemble de 100 arbres de décision, utilisant tous les cœurs CPU disponibles (n_jobs=-1).

The documentation for this class was generated from the following file:

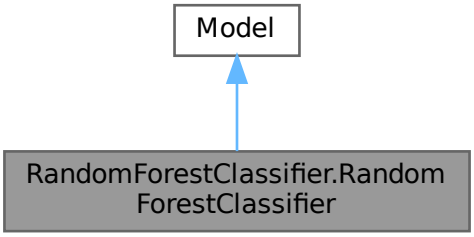
- src/RandomForestClassifier.py

6.23 RandomForestClassifier.RandomForestClassifier Class Reference

Inheritance diagram for RandomForestClassifier.RandomForestClassifier:



Collaboration diagram for RandomForestClassifier.RandomForestClassifier:



Public Member Functions

- __init__ (self, logger, n_train, n_val)

Protected Member Functions

- _create_model (self, ∗∗kwargs)

  Configure et retourne le classificateur Random Forest.

6.23.1 Detailed Description

Definition at line 10 of file RandomForestClassifier.py.

6.23.2 Constructor & Destructor Documentation

6.23.2.1 __init__()

```
RandomForestClassifier.RandomForestClassifier.__init__ (
              self,
              logger,
              n_train,
              n_val )
```

Definition at line 11 of file RandomForestClassifier.py.

6.23.3 Member Function Documentation

6.23.3.1 _create_model()

```
RandomForestClassifier.RandomForestClassifier._create_model (
              self,
             ** kwargs )  [protected]
```

Configure et retourne le classificateur Random Forest.

Parameters

kwargs	Arguments supplémentaires pour `sklearn.ensemble.RandomForestClassifier`.

Returns

sklearn.ensemble.RandomForestClassifier Le modèle configuré.

Definition at line 18 of file RandomForestClassifier.py.

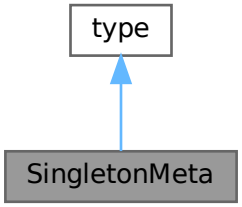
The documentation for this class was generated from the following file:

- src/RandomForestClassifier.py

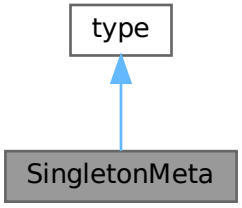
6.24 SingletonMeta Class Reference

Métaclasse implémentant le design pattern Singleton.

Inheritance diagram for SingletonMeta:



Collaboration diagram for SingletonMeta:



6.24.1 Detailed Description

Métaclasse implémentant le design pattern Singleton.

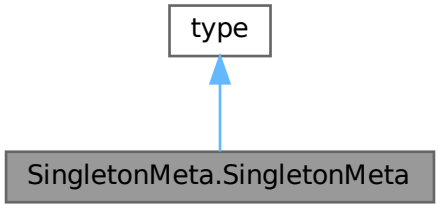
Cette classe assure qu'une classe qui l'utilise comme métaclasse n'aura qu'une seule instance partagée tout au long du cycle de vie de l'application.

The documentation for this class was generated from the following file:

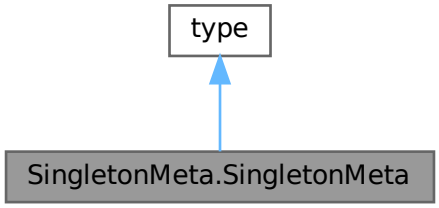
- utils/SingletonMeta.py

6.25 SingletonMeta.SingletonMeta Class Reference

Inheritance diagram for SingletonMeta.SingletonMeta:



Collaboration diagram for SingletonMeta.SingletonMeta:



Public Member Functions

- __call__ (cls, *args, **kwargs)

  Méthode spéciale appelée lors de l'instanciation de la classe.

Static Protected Attributes

- dict _instances = {}

6.25.1 Detailed Description

Definition at line 7 of file SingletonMeta.py.

6.25.2 Member Function Documentation

6.25.2.1 __call__()

```
SingletonMeta.SingletonMeta.__call__ (
              cls,
             * args,
             ** kwargs )
```

Méthode spéciale appelée lors de l'instanciation de la classe.

Vérifie si une instance de la classe existe déjà dans `_instances`. Si oui, retourne l'instance existante. Sinon, appelle le constructeur parent, stocke la nouvelle instance et la retourne.

Parameters

cls	La classe en cours d'instanciation.
args	Arguments positionnels passés au constructeur.
kwargs	Arguments nommés passés au constructeur.

Returns

L'instance unique de la classe.

Definition at line 19 of file SingletonMeta.py.

6.25.3 Member Data Documentation

6.25.3.1 _instances

```
dict SingletonMeta.SingletonMeta._instances = {}  [static], [protected]
```

Definition at line 8 of file SingletonMeta.py.

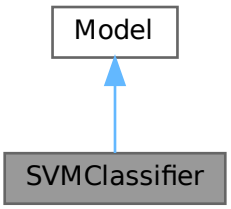
The documentation for this class was generated from the following file:

- utils/SingletonMeta.py

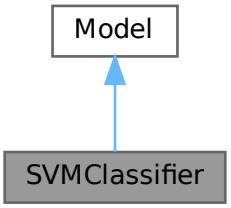
6.26 SVMClassifier Class Reference

Implémentation d'un classificateur Support Vector Machine (SVM) à noyau gaussien.

Inheritance diagram for SVMClassifier:



Collaboration diagram for SVMClassifier:



6.26.1 Detailed Description

Implémentation d'un classificateur Support Vector Machine (SVM) à noyau gaussien.

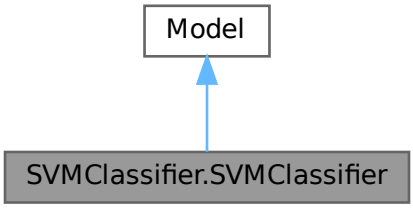
Utilise un pipeline Scikit-learn incluant une standardisation, une réduction de dimension (PCA) conservant 95% de variance, et un SVC à noyau RBF.

The documentation for this class was generated from the following file:

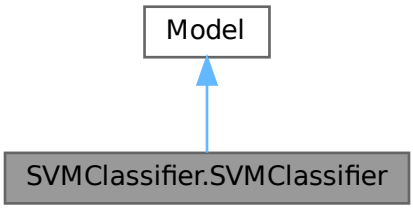
- src/SVMClassifier.py

6.27 SVMClassifier.SVMClassifier Class Reference

Inheritance diagram for SVMClassifier.SVMClassifier:



Collaboration diagram for SVMClassifier.SVMClassifier:



Public Member Functions

- __init__ (self, logger, n_train, n_val)

Protected Member Functions

- _create_model (self, ∗∗kwargs)

  Crée le pipeline SVM.

6.27.1 Detailed Description

Definition at line 14 of file SVMClassifier.py.

6.27.2 Constructor & Destructor Documentation

6.27.2.1 __init__()

```
SVMClassifier.SVMClassifier.__init__ (
              self,
              logger,
              n_train,
              n_val )
```

Definition at line 16 of file SVMClassifier.py.

6.27.3 Member Function Documentation

6.27.3.1 _create_model()

```
SVMClassifier.SVMClassifier._create_model (
              self,
             ** kwargs )  [protected]
```

Crée le pipeline SVM.

Parameters

kwargs	Arguments supplémentaires passés au constructeur SVC.

Returns

sklearn.pipeline.Pipeline Pipeline configuré (StandardScaler -> PCA -> SVC).

Definition at line 23 of file SVMClassifier.py.

The documentation for this class was generated from the following file:

- src/SVMClassifier.py

6.28 TqdmToLogger Class Reference

Redirige la sortie standard (utilisée par tqdm) vers le logger de l'application.

6.28.1 Detailed Description

Redirige la sortie standard (utilisée par tqdm) vers le logger de l'application.

Permet d'afficher les barres de progression textuelles générées par la bibliothèque tqdm directement dans le widget Text de l'interface Tkinter, en gérant le rafraîchissement des lignes.

The documentation for this class was generated from the following file:

- utils/TqdmToLogger.py

6.29 TqdmToLogger.TqdmToLogger Class Reference

Public Member Functions

- __init__ (self, logger, tag="INFO")

  Constructeur de la classe TqdmToLogger.
- write (self, buf)

  Écrit le contenu du buffer dans le logger.
- flush (self)

  Méthode de vidage du buffer (requise par l'interface file-like).

Private Attributes

- __logger
- __tag
- __first_line

6.29.1 Detailed Description

Definition at line 6 of file TqdmToLogger.py.

6.29.2 Constructor & Destructor Documentation

6.29.2.1 __init__()

```
TqdmToLogger.TqdmToLogger.__init__ (
              self,
              logger,
              tag = "INFO" )
```

Constructeur de la classe TqdmToLogger.

Parameters

logger	(Logger) L'instance du logger principal de l'application.
tag	(str) Le tag de couleur à utiliser pour l'affichage (par défaut "INFO").

Definition at line 11 of file TqdmToLogger.py.

6.29.3 Member Function Documentation

6.29.3.1 flush()

```
TqdmToLogger.TqdmToLogger.flush (
              self )
```

Méthode de vidage du buffer (requise par l'interface file-like).

Ne fait rien dans cette implémentation car l'affichage est géré directement dans write().

Definition at line 30 of file TqdmToLogger.py.

6.29.3.2 write()

```
TqdmToLogger.TqdmToLogger.write (
              self,
              buf )
```

Écrit le contenu du buffer dans le logger.

Cette méthode est appelée par tqdm. Elle détecte si le buffer contient du texte, et demande au logger de l'afficher. Gère le mode `buffered` pour éviter l'empilement des lignes de progression.

Parameters

buf	(str) La chaîne de caractères envoyée par tqdm.

Definition at line 22 of file TqdmToLogger.py.

6.29.4 Member Data Documentation

6.29.4.1 __first_line

```
TqdmToLogger.TqdmToLogger.__first_line  [private]
```

Definition at line 14 of file TqdmToLogger.py.

6.29.4.2 __logger

```
TqdmToLogger.TqdmToLogger.__logger  [private]
```

Definition at line 12 of file TqdmToLogger.py.

6.29.4.3 __tag

```
TqdmToLogger.TqdmToLogger.__tag  [private]
```

Definition at line 13 of file TqdmToLogger.py.

The documentation for this class was generated from the following file:

- utils/TqdmToLogger.py

6.30 Window Class Reference

Classe gérant l'interface graphique (GUI) de l'application.

Public Attributes

- bool TEST = True

6.30.1 Detailed Description

Classe gérant l'interface graphique (GUI) de l'application.

Cette classe initialise la fenêtre principale (Tkinter), construit les onglets, les formulaires de configuration (entraînement, test, inférence) et gère l'affichage des résultats (graphiques, logs, images).

6.30.2 Member Data Documentation

6.30.2.1 TEST

```
bool Window.TEST = True
```

Definition at line 9 of file Window.py.

The documentation for this class was generated from the following file:

- Window.py

6.31 Window.Window Class Reference

Public Member Functions

- __init__ (self)

  Constructeur de la classe Window.
- get_root (self)

  Retourne l'objet racine Tkinter.
- get_console (self)

  Retourne le widget de texte utilisé pour la console de logs.
- get_train_button (self)

  Retourne le bouton d'entraînement.
- get_dataset_folder (self)

  Retourne la variable Tkinter contenant le chemin du dossier dataset.
- get_train_data (self)

  Retourne la variable Tkinter contenant la taille des données d'entraînement.
- get_val_data (self)

  Retourne la variable Tkinter contenant la taille des données de validation.
- get_test_button (self)

Retourne le bouton de test.

- get_inference_button (self)

  Retourne le bouton d'inférence.
- update_model_info (self, event)

  Met à jour les informations affichées lors de la sélection d'un modèle.
- create_training_results_tab (self, model_name, metrics_data, confusion_matrix_fig=None, history=None)

  Crée et ajoute un onglet affichant les résultats d'un entraînement.
- create_inference_results_tab (self, results)

  Crée et ajoute un onglet affichant les résultats d'inférence.
- select_dataset (self)

  Ouvre un sélecteur de dossier pour choisir le dataset.
- close_tab (self, tab)

  Ferme un onglet spécifique.
- get_tab_system (self)

  Retourne le gestionnaire d'onglets (Notebook).
- get_selected_model (self)

  Retourne le nom du modèle actuellement sélectionné.
- select_inference_data (self)

  Ouvre un sélecteur de fichier ou de dossier pour l'inférence selon le mode choisi.
- get_inference_data (self)

  Retourne la variable Tkinter contenant le chemin des données d'inférence.
- run (self)

  Lance la boucle principale de l'interface graphique.

Public Attributes

- update_model_info

Private Attributes

6.31.1 Detailed Description

Definition at line 18 of file Window.py.

6.31.2 Constructor & Destructor Documentation

6.31.2.1 __init__()

```
Window.Window.__init__ (
              self )
```

Constructeur de la classe Window.

Initialise l'environnement graphique, crée le dossier `_models` si nécessaire, et construit tous les widgets de l'interface (onglets, boutons, champs de saisie, console).

Definition at line 23 of file Window.py.

6.31.3 Member Function Documentation

6.31.3.1 close_tab()

```
Window.Window.close_tab (
              self,
              tab )
```

Ferme un onglet spécifique.

Parameters

tab	(tk.Widget) Le widget représentant l'onglet à fermer.

Definition at line 672 of file Window.py.

6.31.3.2 create_inference_results_tab()

```
Window.Window.create_inference_results_tab (
              self,
              results )
```

Crée et ajoute un onglet affichant les résultats d'inférence.

Affiche une liste déroulante d'images avec leur prédiction associée.

Parameters

results	(list) Liste de tuples (nom_fichier, prédiction, tableau_image).

Definition at line 553 of file Window.py.

6.31.3.3 create_training_results_tab()

```
Window.Window.create_training_results_tab (
              self,
              model_name,
              metrics_data,
              confusion_matrix_fig = None,
              history = None )
```

Crée et ajoute un onglet affichant les résultats d'un entraînement.

Construit l'interface pour afficher les métriques (précision, rappel, F1), le rapport de classification, la matrice de confusion et l'historique (si applicable).

Parameters

model_name	(str) Le nom du modèle entraîné.
metrics_data	(dict) Dictionnaire contenant les métriques calculées.
confusion_matrix_fig	(matplotlib.figure.Figure, optional) Figure de la matrice de confusion.
history	(matplotlib.figure.Figure, optional) Figure de l'historique d'entraînement (pour CNN).

Definition at line 376 of file Window.py.

6.31.3.4 get_console()

```
Window.Window.get_console (
              self )
```

Retourne le widget de texte utilisé pour la console de logs.

Returns

(tk.Text) Le widget de texte des logs.

Definition at line 304 of file Window.py.

6.31.3.5 get_dataset_folder()

```
Window.Window.get_dataset_folder (
              self )
```

Retourne la variable Tkinter contenant le chemin du dossier dataset.

Returns

(tk.StringVar) La variable liée au champ dataset.

Definition at line 316 of file Window.py.

6.31.3.6 get_inference_button()

```
Window.Window.get_inference_button (
              self )
```

Retourne le bouton d'inférence.

Returns

(tk.Button) Le bouton "Classify Image(s)".

Definition at line 340 of file Window.py.

6.31.3.7 get_inference_data()

```
Window.Window.get_inference_data (
              self )
```

Retourne la variable Tkinter contenant le chemin des données d'inférence.

Returns

(tk.StringVar) La variable liée au champ d'inférence.

Definition at line 702 of file Window.py.

6.31.3.8 get_root()

```
Window.Window.get_root (
              self )
```

Retourne l'objet racine Tkinter.

Returns

(tk.Tk) L'objet fenêtre principale.

Definition at line 298 of file Window.py.

6.31.3.9 get_selected_model()

```
Window.Window.get_selected_model (
              self )
```

Retourne le nom du modèle actuellement sélectionné.

Returns

(str) Le nom du modèle.

Definition at line 684 of file Window.py.

6.31.3.10 get_tab_system()

```
Window.Window.get_tab_system (
              self )
```

Retourne le gestionnaire d'onglets (Notebook).

Returns

(ttk.Notebook) Le gestionnaire d'onglets principal.

Definition at line 678 of file Window.py.

6.31.3.11 get_test_button()

```
Window.Window.get_test_button (
              self )
```

Retourne le bouton de test.

Returns

(tk.Button) Le bouton "Test Model".

Definition at line 334 of file Window.py.

6.31.3.12 get_train_button()

```
Window.Window.get_train_button (
              self )
```

Retourne le bouton d'entraînement.

Returns

(tk.Button) Le bouton "Train Model".

Definition at line 310 of file Window.py.

6.31.3.13 get_train_data()

```
Window.Window.get_train_data (
              self )
```

Retourne la variable Tkinter contenant la taille des données d'entraînement.

Returns

(tk.StringVar) La variable de taille d'entraînement.

Definition at line 322 of file Window.py.

6.31.3.14 get_val_data()

```
Window.Window.get_val_data (
              self )
```

Retourne la variable Tkinter contenant la taille des données de validation.

Returns

(tk.StringVar) La variable de taille de validation.

Definition at line 328 of file Window.py.

6.31.3.15 run()

```
Window.Window.run (
              self )
```

Lance la boucle principale de l'interface graphique.

Cette méthode bloque l'exécution jusqu'à la fermeture de la fenêtre.

Definition at line 708 of file Window.py.

6.31.3.16 select_dataset()

```
Window.Window.select_dataset (
              self )
```

Ouvre un sélecteur de dossier pour choisir le dataset.

Definition at line 666 of file Window.py.

6.31.3.17 select_inference_data()

```
Window.Window.select_inference_data (
              self )
```

Ouvre un sélecteur de fichier ou de dossier pour l'inférence selon le mode choisi.

Definition at line 689 of file Window.py.

6.31.3.18 update_model_info()

```
Window.Window.update_model_info (
              self,
              event )
```

Met à jour les informations affichées lors de la sélection d'un modèle.

Vérifie l'existence du modèle sur le disque et affiche un message d'erreur si nécessaire.

Parameters

event	L'événement Tkinter déclencheur (changement de sélection).

Definition at line 347 of file Window.py.

7.3.1 Detailed Description

Point d'entrée principal de l'application de classification.

Ce script orchestre le lancement de l'application en suivant le pattern MVC :

1. Instanciation de la vue (Window).
2. Instanciation du contrôleur (Controller) qui lie la logique à la vue.
3. Démarrage de la boucle d'événements principale (mainloop).
